Thank you for purchasing our Multi-function Keypad TP-G1-CLS / TP-G1-ELS.

• This product is designed to remotely control the FRENIC-Lift series of inverters. Read through this instruction manual and the FRENIC-Lift Instruction Manual, and be familiar with the handling procedure for correct use.

• Improper handling blocks correct operation or causes a short life or failure.

• Deliver this manual to the end user of the product. Keep this manual in a safe place until the multi-function keypad is discarded.

• For the usage of inverters and optional equipment, refer to the instruction manuals prepared for the FRENIC-Lift series of inverters and its optional equipment.
Preface
Thank you for purchasing our multi-function keypad TP-G1-CLS / TP-G1-ELS.
By installing the multi-function keypad directly on a FRENIC-Lift as an attached keypad or connecting them together using an optional remote operation extension cable (CB-5S, CB-3S, or CB-1S, depending on the distance), you can operate the inverter locally or remotely. In either mode, you can run and stop the motor, monitor the running status, and set the function codes. In addition, you can perform "data copying": You can read function code data from an inverter, copy (write) it into another inverter, or verify it.
Before installing and using the multi-function keypad, read through this manual in conjunction with the FRENIC-Lift Instruction Manual (INR-SI47-1038-E) and familiarize yourself with its proper use. Improper use may prevent normal operation or cause a failure or reduced life of the inverter.
The LCD on the multi-function keypad may display each function code name as “FUNCTION.” For the proper function code name refer to the FRENIC-Lift Instruction Manual (INR-SI47-1038-E) and the FRENIC-Lift Reference Manual (INR-SI47-1068-E).
Related Publications
Listed below are other publications on the FRENIC-Lift to be consulted in conjunction with this manual as necessary.
- FRENIC-Lift Instruction Manual (INR-SI47-1038-E)
- FRENIC-Lift Reference Manual (INR-SI47-1068-E)
The materials are subject to change without notice. Be sure to obtain the latest editions for use.

■ About the ROM version of multi-function keypad
Please read manual (INR-SI47-1056-E) when ROM version of a multi-function keypad is 8510. It might be different from the content of the description of this manual.
Please refer to this Manual 3.4.6 Reading maintenance information Menu #5 "Maintenance Information" for the confirm method of ROM version of multi-function keypad.

■ Safety precautions
Read this manual thoroughly before proceeding with installation, connections (wiring), operation, or maintenance and inspection. Ensure you have sound knowledge of the device and familiarize yourself with all safety information and precautions before proceeding to operate the inverter.
Safety precautions are classified into the following two categories in this manual.

| WARNING | Failure to heed the information indicated by this symbol may lead to dangerous conditions, possibly resulting in death or serious bodily injuries. |
| CAUTION | Failure to heed the information indicated by this symbol may lead to dangerous conditions, possibly resulting in minor or light bodily injuries and/or substantial property damage. |

Failure to heed the information contained under the CAUTION title can also result in serious consequences. These safety precautions are of utmost importance and must be observed at all times.
### Operation

<table>
<thead>
<tr>
<th>WARNING</th>
</tr>
</thead>
</table>
| • Be sure to install the terminal block cover and the front cover before turning the power on. Do not remove the covers while power is applied.  
  Otherwise electric shock could occur. |
| • Do not operate switches/buttons with wet hands.  
  Doing so could cause electric shock. |
| • If the retry function has been selected, the inverter may automatically restart and drive the motor depending on the cause of tripping. Design the machinery or equipment so that human safety is ensured after restarting.  
  Never make an alarm reset with the operation signal being on. Doing so will suddenly restart the inverter. Ensure that the operation signal is turned off beforehand.  
  Otherwise an accident could occur. |
| • If you set the function codes wrongly or without completely understanding this instruction manual, the FRENIC-Lift Instruction Manual (INR-SI47-1038-E) and the FRENIC-Lift Reference Manual (INR-SI47-1068-E), the motor may rotate with a torque or at a speed not permitted for the machine.  
  An accident or injuries could occur. |
| • Do not touch the inverter terminals while the power is applied to the inverter even if the inverter stops.  
  Doing so could cause electric shock. |

### Wiring

<table>
<thead>
<tr>
<th>WARNING</th>
</tr>
</thead>
</table>
| • Do not operate the switch with wet hands.  
  Doing so could cause electric shock. |
| • Before opening the cover of the inverter to install the multi-function keypad, turn the power off and wait for at least five minutes. Further, make sure that the LED monitor is turned off, the charger indicator is off, and the DC link bus voltage between the terminals P (+) and N (−) has dropped below the safe voltage level (+25 VDC), using a circuit tester or another appropriate instrument.  
  Otherwise electric shock could occur. |
| • In general, the insulation property of the sleeve of the signal wire and that of the sheath of the signal cable are not sufficient for high voltages. Therefore, if a signal wire or cable comes into direct contact with a live part of the main circuit, the insulation may be broken, causing the signal wire to be exposed to the high voltage of the main circuit. Be sure to keep all signal wires and cables away from live parts of the main circuit.  
  Otherwise, an accident or electric shock could occur. |
Disposal

⚠️ CAUTION

- For disposal, treat the multi-function keypad as industrial waste.
Otherwise injuries could occur.

Others

⚠️ WARNING

- Never attempt to modify the multi-function keypad or inverter.
Doing so could cause electric shock or injuries.

GENERAL PRECAUTIONS

Drawings in this manual may be illustrated without covers or safety shields for explanation of detail parts. Restore the covers and shields in the original state and observe the description in the manual before starting operation.

How this manual is organized

This manual is made up of chapters 1 through 4

Chapter 1  BEFORE USING THE MULTI-FUNCTION KEYPAD

This chapter describes the points to check upon delivery and lists the inverters the multi-function keypad is designed to interface with.

Chapter 2  INSTALLATION AND INTERCONNECTION

This chapter describes how to install the multi-function keypad and how to interconnect it with an inverter.

Chapter 3  OPERATION USING THE MULTI-FUNCTION KEYPAD

This chapter describes the operation of the inverter using the multi-function keypad. More specifically, this chapter gives an overview of the inverter’s three operation modes (Running, Programming, and Alarm modes) and describes how to run and stop the inverter/motor, set function code data, monitor running status, view maintenance information and alarm data, and perform data copying.

Chapter 4  SPECIFICATIONS

This chapter lists the general specifications such as operating environments, communication specifications and transmission specifications.

Icons

The following icons are used throughout this manual:

- **Note** This icon indicates information which, if not heeded, can result in the product not operating to full efficiency, as well as information concerning incorrect operations and settings which can result in accidents.

- **Tip** This icon indicates information that can prove handy when performing certain settings or operations.

- This icon indicates a reference to more detailed information.

Chapter 1  BEFORE USING THE MULTI-FUNCTION KEYPAD

1.1 Acceptance Inspection

Unpack the package and check the following:

1. The package contains a multi-function keypad and the following attached goods.
   - Multi-function keypad fixing screws
   - Instruction manual (this book)

2. There have been no problems during transportation. In particular, no parts are damaged or have fallen out of place nor are there any dents on the body.

3. The model name "TP-G1-CLS" or "TP-G1-ELS" is printed on the back of the multi-function keypad as shown in Figure 1.1. The language that can be displayed is different in each model name. (Refer to the table below)

<table>
<thead>
<tr>
<th>Model name</th>
<th>Language that can be displayed</th>
</tr>
</thead>
<tbody>
<tr>
<td>TP-G1-CLS</td>
<td>Chinese, English, Japanese</td>
</tr>
<tr>
<td>TP-G1-ELS</td>
<td>English, Japanese, German, French Spanish, Italian</td>
</tr>
</tbody>
</table>

If you suspect the product is not working properly or if you have any questions about your product, contact your Fuji Electric representative.

1.2 Inverters with which the Multi-function Keypad Interfaces

The multi-function keypad interfaces with the following Fuji inverters:

<table>
<thead>
<tr>
<th>Series</th>
<th>Type of inverter*</th>
<th>Remarks</th>
</tr>
</thead>
<tbody>
<tr>
<td>FRENIC-Lift</td>
<td>FRN□□□LM1S-□□</td>
<td>No restriction is there for use of this product.</td>
</tr>
<tr>
<td></td>
<td>FRN□□□LM1S-4□□</td>
<td></td>
</tr>
</tbody>
</table>

* Type of inverter

For the details of the Inverter type identification, refer to the FRENIC-Lift Instruction Manual (INR-S417-1036-E), Chapter 1, Section 1.1 "Acceptance Inspection."
Chapter 2 INSTALLATION AND INTERCONNECTION

2.1 Accessories and Parts Required for Interconnection

To install the multi-function keypad on the enclosure’s panel instead of the inverter, you need the following accessories and parts:

<table>
<thead>
<tr>
<th>Accessories/Parts</th>
<th>Type or Specifications</th>
<th>Remarks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Remote operation extension cable*1</td>
<td>CB-5S, CB-3S, or CB-1S</td>
<td>You have a choice of three lengths: 5 m, 3 m, and 1 m.</td>
</tr>
<tr>
<td>Screws (for mounting the multi-function keypad)</td>
<td>M3 x 27</td>
<td>Provide 2 screws (to be provided by the customer) beforehand.</td>
</tr>
</tbody>
</table>

*1: Alternatively, you can use an off-the-shelf 10BASE-T/100BASE-TX LAN cable (straight type) that meets the ANSI/TIA/EIA-568A Category 5 standard (maximum length: 20 m).
Recommended LAN cable:
Manufacturer: Sanwa Supply, Co. Ltd.
Model: KB-10T5-01K (for 1 m)
        KB-STP-01K (for 1 m) (shielded cable, EMC-compliant)

*2: Use the screws of the length just right for the panel. (See Figure 2.7.)
2.2 Installing the Multi-function Keypad

2.2.1 Three ways of installation/use

You can install the multi-function keypad in one of the following three ways:

- Install it directly on the inverter (see Figure 2.1).
- Install it on the front panel of enclosure (see Figure 2.2).
- Use it remotely in your hand (see Figure 2.3).

![Figure 2.1 Installing Multi-function Keypad Directly on Inverter](image1)

![Figure 2.2 Installing Multi-function Keypad on Enclosure](image2)

![Figure 2.3 Using Multi-function Keypad remotely in Your Hand](image3)
2.2.2 Installing the multi-function keypad

After completion of interconnection, follow the next steps to install the multi-function keypad in place. Be sure to turn off the power of the inverter beforehand.

- Installing the multi-function keypad directly on the inverter

1. Remove the blind cover mounted on the inverter.
   Pull the blind cover toward you while holding down the hook (as directed by the arrows in Figure 2.4 below).

2. Mount the multi-function keypad onto the inverter.
   Put the multi-function keypad in the original slot while engaging its bottom latches with the holes (as shown below), and push it onto the case of the inverter (arrow 2) while holding it downward (against the terminal block cover) (arrow 1).

![Figure 2.4 Removing the Blind Cover](image)

![Figure 2.5 Mounting the Multi-function Keypad](image)
Protection from abnormal vibration: for inverters with capacity of 22 kW or less

In an environment with large ambient vibrations, the inverter may be exposed to them, causing abnormal vibrations on the multi-function keypad. If this happens, remove the terminal block cover and the front cover, then secure the multi-function keypad to the inverter with the attached screw (Two). After that, reinstall those covers.

For the procedures for removing the covers, refer to the FRENIC-Lift Instruction Manual (INR-SI47-1038-E), Chapter 2, Section 2.3.1 “Removing and mounting the terminal block (TB) cover and the front cover.”

Figure 2.6 Fixing the Multi-function Keypad
Installing the multi-function keypad on the enclosure panel

1. Cut the panel out for a single square area and perforate two screw holes in the panel of the enclosure as shown in Figure 2.7.

*If the thickness of the enclosure is outside the range shown above, use screws of an appropriate length.

Figure 2.7  Dimensions of Square Cut-out and Screw Holes
Mount the multi-function keypad onto the enclosure with 2 screws as shown in Figure 2.8. (Recommended tightening torque: 0.7 N•m)

Remove the blind cover mounted on the inverter (see Figure 2.4) and, using a remote operation extension cable or a LAN cable, interconnect the multi-function keypad and the inverter (insert one end of the cable into the RS485 port with RJ-45 connector on the multi-function keypad and the other end into that on the inverter) (See Figure 2.9.).

Using the multi-function keypad in hand
Follow step ③ of "Installing the multi-function keypad on the enclosure panel" above.
Chapter 3  OPERATION USING THE MULTI-FUNCTION KEYPAD

3.1 Components on the Keypad

The keypad allows you to start and stop the motor, view various data including maintenance information and alarm information, set function codes, monitor I/O signal status, copy data, and calculate the load factor.
<table>
<thead>
<tr>
<th>Item</th>
<th>Monitors and Keys</th>
<th>Functions</th>
</tr>
</thead>
</table>
| 7-segment LED monitor and LCD monitor | Five-digit, 7-segment LED monitor which displays the following according to the operation modes:  
- In Running mode: Running status information (reference speed (final), output current and voltage, etc.)  
- In Programming mode: Same as above.  
- In Alarm mode: Alarm code, which identifies the cause of an alarm if the protective function is activated.  
| LCD monitor which displays the following according to the operation modes:  
- In Running mode: Running status information  
| In Programming mode: Menus, function codes and their data  
| In Alarm mode: Alarm code, which identifies the cause of an alarm if the protective function is activated. |
| Indicator indexes | In Running mode, these indexes show the unit of the number displayed on the 7-segment LED monitor and the running status information on the LCD monitor. For details, see the next page. |
| Programming keys | Switches the operation modes of the inverter. |
| | Shifts the cursor to the right when entering a number. |
| | Pressing this key after removing the cause of an alarm will switch the inverter to Running mode.  
This key is used to reset settings or screen transition. |
| | UP and DOWN keys. These keys are used to select the setting items or change the function code data. |
| Function/Data key | This key switches the operation as follows:  
- In Running mode: Pressing this key switches the information to be displayed concerning the status of the inverter (reference speed (final), output current and voltage, etc.).  
- In Programming mode: Pressing this key displays the function code and establishes the newly entered data.  
- In Alarm mode: Pressing this key displays the details of the problem indicated by the alarm code that has appeared on the LED monitor. |
<p>| Operation keys | Starts running the motor in the forward direction. (in local mode only). |
| | Starts running the motor in the reverse direction. (in local mode only). |
| | Stops the motor. (in local mode only) |
| | Holding down this key for more than 1 second toggles between Local and Remote modes. |
| LED indicator | Lights while a run command is supplied to the inverter. |</p>

</table>

*1 Function code C21 provides a choice of units--r/min, m/min, and Hz.

The speed-frequency conversion formulas are given below.

\[
[P01]\times 120 \times \frac{[Hz]}{P01} = \frac{[r/min]}{F03} \times 120 \times \frac{[Hz]}{P01}
\]

Indicators for the unit of number displayed on the LED monitor:

- FWD
- REV
- STOP
- REM
- LOC
- COMM
- JOG
- HAND

Indicators for the running status and run command source:
3.2 Overview of Operation Modes

FRENIC-Lift features the following three operation modes:

- **Running mode:** This mode allows you to enter run/stop commands in regular operation. You can also monitor the running status in real time.

- **Programming mode:** This mode allows you to set function code data and check a variety of information relating to the inverter status and maintenance.

- **Alarm mode:** If an alarm condition arises, the inverter automatically enters the Alarm mode. In this mode, you can view the corresponding alarm code* and its related information on the LED and LCD monitors.

* Alarm code represents the type of alarms that have been triggered by the protection function. For details, refer to the FRENIC-Lift Instruction Manual (INR-SI47-1038-E), Chapter 8, Section 8.5 "Protection Features."

Figure 3.1 shows the status transition of the inverter between these three operation modes.
3.3 Running Mode

When the inverter is turned on, it automatically enters Running mode. In Running mode, you can:

1. Run or stop the motor (in local mode only),
2. Set the reference speed (pre-ramp) (in local mode only), and
3. Monitor the running status (e.g., reference speed (final), output current, etc.)

3.3.1 Running/stopping the motor

In local mode, pressing the [ FWD ] or [ REV ] key starts running the motor in the forward or reverse direction, respectively. Pressing the [ STOP ] key decelerates the motor to stop. This keypad operation is enabled only in Running and Programming modes.

Figure 3.2 Rotational Direction of Motor

Note) The rotational direction of IEC-compliant motor is opposite to the one shown here.

Displaying the running status on the LCD monitor

(1) When function code E45 data (LCD monitor item selection) is set to "0"

The LCD monitor displays the running status, the rotational direction, and the operation guide.

(The lower indicators show the running status and run command source. For the upper ones, see Section 3.3.3.)

Figure 3.3 Display of Running Status

The running status and the rotational direction are displayed as listed in Table 3.2.

<table>
<thead>
<tr>
<th>Status/Direction</th>
<th>Display</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>Running status</td>
<td>RUN</td>
<td>A run command is present or the inverter is driving the motor.</td>
</tr>
<tr>
<td></td>
<td>STOP</td>
<td>A run command is not present and the inverter is stopped.</td>
</tr>
<tr>
<td>Rotational direction</td>
<td>FWD</td>
<td>Forward rotation being commanded.</td>
</tr>
<tr>
<td></td>
<td>REV</td>
<td>Reverse rotation being commanded.</td>
</tr>
<tr>
<td></td>
<td>Blank</td>
<td>The inverter is stopped (output shut down) or running at zero speed.</td>
</tr>
</tbody>
</table>
When function code E45 data (LCD monitor item selection) is set to “1”

The LCD monitor displays the reference speed (final), output current, and reference torque in a bar chart. (The lower indicators show the running status and run command source. For the upper ones, see Section 3.3.3.)

The full scale (maximum value) for each item is as follows:
- Reference speed (final): Maximum speed
- Output current: 200% of inverter rated current
- Reference torque: 200% of motor rated torque

Figure 3.4  Bar Chart

Switching between remote and local modes

The inverter can be operated either in remote or local mode. In remote mode, which applies to normal operation, the inverter is driven under the control of the data settings stored in the inverter, whereas in local mode, which applies to maintenance operation, it is separated from the control system and is driven manually under the control of the keypad.

- Remote mode: The run and speed command sources are determined by source switching signals including function codes and communications link operation signal. The keypad cannot be used as a command source.
- Local mode: The keypad is enabled as a run and speed command source, regardless of the settings specified by function codes. The keypad takes precedence over a communications link operation signal or other command sources.

Holding down the key for at least one second switches between remote and local modes. Switching to remote mode turns on the lower indicator above the REM index, and switching to local mode, above the LOC index.

When the mode is switched from remote to local, the reference speed (pre-ramp) specified in remote mode is automatically inherited. Further, if the run command is ON at the time of the switching, the inverter automatically turns on such a run command in the keypad that carries over the rotational direction.

Figure 3.5  Transition between Remote and Local Modes

⚠️ WARNING

In local mode, operation (such as issuing run or speed command) on the remote side is disabled. Do not switch from remote to local mode while the motor is loaded.

Accidents or injuries may result.
3.3.2 Setting the reference speed (pre-ramp)

You can set the reference speed (pre-ramp) in frequency (Hz) with the \(\uparrow/\downarrow\) keys on the keypad in local mode.

Using \(\uparrow/\downarrow\) keys in local mode

(1) Switch the keypad to Running mode. This is because in Programming or Alarm mode, the \(\uparrow/\downarrow\) keys are disabled to set the reference speed (pre-ramp).

(2) Press the \(\uparrow/\downarrow\) keys to display the reference speed (pre-ramp) on the LCD monitor with the lowermost digit blinking.

(3) The newly specified speed is not automatically saved in the inverter, so specify the speed again if necessary when you restart the inverter.

- When the speed monitor is selected (E43 = 0), the reference speed (pre-ramp) can be specified with the \(\uparrow/\downarrow\) keys.

- E48 specifies the speed-monitoring formats (unit). For details about the LED monitor, refer to Section 3.3.3.

- When you start accessing the reference speed (pre-ramp) with the \(\uparrow/\downarrow\) keys, the lowest digit on the display will blink and start changing. As you are holding down the key, blinking will gradually move to the upper digit places and the upper digits will be changeable.

- Pressing the \(\uparrow\) key moves the changeable digit place (blinking) and thus allows you to change upper digits easily.

Figure 3.6  Setting the Speed Command in Local Mode

Tip

- When the speed monitor is selected (E43 = 0), the reference speed (pre-ramp) can be specified with the \(\uparrow/\downarrow\) keys.
- E48 specifies the speed-monitoring formats (unit). For details about the LED monitor, refer to Section 3.3.3.
- When you start accessing the reference speed (pre-ramp) with the \(\uparrow/\downarrow\) keys, the lowest digit on the display will blink and start changing. As you are holding down the key, blinking will gradually move to the upper digit places and the upper digits will be changeable.
- Pressing the \(\uparrow\) key moves the changeable digit place (blinking) and thus allows you to change upper digits easily.
3.3.3 Monitoring the running status on the LED monitor

The ten items listed below can be monitored on the 7-segment LED monitor. Immediately after the power is turned ON, the monitor item specified by function code E43 is displayed.

Pressing the key in Running mode switches between monitor items in the sequence shown in Table 3.4.

<table>
<thead>

**Function codes requiring simultaneous keying**

To modify the data for function code F00 (Data Protection), H03 (Data Initialization), H97 (Clear Alarm Data), or H99 (Password Protection), simultaneous keying is needed, involving the + keys or the + keys.

**Changing, validating, and saving function code data when the invert is running**

Some function codes can be changed while the inverter is running, whereas others cannot. Further, depending on the function code, modifications may or may not become effective immediately. For details, refer to the “Change when running” column in Section 5.1 “Function Code Tables” in the FRENIC-Lift Instruction Manual (INR-SI47-1038-E).

For details of function codes, refer to the FRENIC-Lift Reference Manual (INR-SI47-1068-E).

Figure 3.9 shows the LCD screen transition for "1. DATA SET."

---

3-10
Press the \( \Box \) key to establish the function code data.

Press the \( \Box \) key to cancel the data change.

Figure 3.11  Changing Function Code Data
Basic key operation

This section gives a description of the basic key operation, following the example of the function code data changing procedure shown in Figure 3.10.

This example changes function code F03 data (maximum speed) from 1801.00 to 1802.00 r/min.

1. When the inverter is powered on, it automatically enters Running mode. In Running mode, press the key to enter Programming mode. The menu for function selection will appear.

2. Use the keys to move the pointer to "1. DATA SET" and then press the key. A list of function codes appears.

3. Use the keys to select the target function code group (F03 in this example) and press the key, which displays the screen for changing the target function code data.

4. Use the keys to change the function code data. Pressing the key causes the blinking digit place to shift (cursor shifting) (The blinking digit can be changed).

5. Press the key to establish the function code data. The data will be saved in the memory inside the inverter. The display will return to the function code list, then move to the next function code (F04 in this example). Pressing the key preceding the key cancels the change made to that function code data. The data reverts to the previous value, the screen returns to the function code list, and the function code (F03) reappears.

6. Press the key to return to the menu from the function code list.

Tip

Additional note on function code being selected

The function code being selected blinks, indicating the movement of the cursor (F03 blinks in this example).
3.4.2 Setting up function codes quickly  -- Menu #0 "Quick Setup" --

Menu #0 "Quick Setup" in Programming mode allows you to quickly set up a fundamental set of function codes that you specify beforehand. Whereas at shipment from factory, no function code is registered for Quick Setup, you can add or delete some function codes using Menu #10 "User Setting." The set of function codes covered by Quick Setup is held in the inverter (not the keypad). Therefore, if you mount your keypad onto another inverter, the set of function codes held in the new inverter is subject to Quick Setup. If necessary, you may copy the set of function codes subject to Quick Setup using the copy function (Menu #8 "Data Copying").

If you perform data initializing (function code H03), the set of function codes subject to Quick Setup will be reset to the factory default.

The LCD screen transition from Menu #0 is the same as with Menu #1 "Data Setting."

**Basic key operation**

Same as the basic key operation for Menu #1 "Data Setting."

3.4.3 Checking changed function codes  -- Menu #2 "Data Checking" --

Menu #2 "Data Checking" in Programming mode allows you to check function codes (together with their data) that have been changed. The function codes changed from the factory default are marked with *. By selecting a particular function code and pressing the \[ \star \] key, you can view or change its data.

The LCD screen transition from Menu #2 is the same as with Menu #1 "Data Setting," except for the different screen listing function codes as shown below.

<table>

*1 In vector control with PG, this item shows the reference torque.
*2 It is not supported in a certain ROM version of the inverter. It displays "---" for symbols not supported. When ROM version of a multi-function keypad is 8800, it doesn’t display "OLM".

Note: FRENIC-Lift supports only symbols listed in the above table. It displays "---" for symbols not supported.

Basic key operation

(1) When the inverter is powered on, it automatically enters Running mode. In Running mode, press the key to enter Programming mode. The menu for function selection will appear.

(2) Use the / keys to move the pointer to "3. OPR MNTR."

(3) Press the key to display the monitor screen (one out of a total of 6 pages).

(4) Use the / keys to select the target item page and confirm the running status information for that item.

(5) Press the key to go back to the menu.

Figure 3.13 shows the LCD screen transition for "3. OPR MNTR."
Select the target menu by moving the pointer \( \mathbb{M} \) with \( \mathbb{L} / \mathbb{H} \) keys.

Press the \( \mathbb{M} \) key to establish the target menu.

---

Figure 3.14 Screen Transition for "4. I/O CHECK" (continued)
**I/O status (hexadecimal)**

Each I/O terminal is assigned to one of the 16 binary bits (bit 0 through bit 15). The bit to which no I/O terminal is assigned is considered to have a value of "0." The I/O status is thus collectively expressed as a hexadecimal number (0 through F).

In the FRENIC-Lift series, digital input terminals [FWD] and [REV] are assigned to bits 0 and 1, [X1] through [X8] to bits 2 through 9, and EN terminal to bit 10, respectively. Each bit assumes a value of "1" when the corresponding signal is ON and a value of "0" when it is OFF(Note). For example, when signals [FWD] and [X1] are ON while all other signals are OFF, the status is expressed as "0005H."

Digital output terminals [Y1] through [Y4] are assigned to bits 0 through 3. Each is given a value of "1" when it is short-circuited to [CMY], or a value of "0" when its circuit to [CMY] is open. The status of relay output terminal [YSA/C] is assigned to bit 4, which assumes a value of "1" when the contact between [YSA] and [YSC] is closed. The status of relay output terminal [30A/B/C] is assigned to bit 8, which assumes a value of "1" when the contact between [30A] and [30C] is closed or "0" when the contact between [30B] and [30C] is closed. For example, when terminal [Y1] is ON, terminals [Y2] to [Y4] are OFF, the contact between [YSA] and [YSC] is opened, and the link between 30A and 30C is closed, then the status is expressed as "0101H."

### Table 3.9  Hexadecimal Notation

<table>
<thead>
<tr>
<th>Data Displayed</th>
<th>Highest digit</th>
<th>Lowest digit</th>
<th>Notation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bit</td>
<td>15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0</td>
<td></td>
<td></td>
</tr>

<td></td>
<td>1 0 1</td>
</tr>
</tbody>
</table>

* Unassigned
*1 (XF), (XR), (RST) are for communication. Refer to the section given below.
*2 (EN) is for monitoring and cannot be used for input entered via a communications link.

**Input status at terminal via communication link**

Input commands sent via RS485 or CAN communications can be displayed in two ways: "Input status at terminal via communication link" or "I/O status (hexadecimal)." The content to be displayed is basically the same as that for the input signal information at control circuit terminals (hexadecimal) of display; however, (XF), (XR), and (RST) are added as inputs. Note it is a display of normal logic (Active-ON) (using the original signals that are not inverted).

**Magnet pole position detection signals in binary**

When the synchronous motor drive option "OPC-LM1-PP" is used, the status of the magnet pole position detection signal input to the option is displayed in binary, "1" for ON and "0" for OFF. F3, F2 (W), F1 (V) and F0 (U) are assigned from the left in this order. When the input signal is ON, it displays "1," and when the input signal is OFF, it displays "0."

**Encoder pulse frequency**

When you set 1 to L01, the frequency of the encoder feedback pulse (Z phase) is displayed. When ROM version of a multi-function keypad is 8800, the decimal point is not displayed.
3.4.6  Reading maintenance information

Menu #5 "Maintenance Information" in Programming mode allows you to view information necessary for performing maintenance on the inverter. Table 3.10 lists the maintenance information display items.

<table>
<thead>
<tr>

<tr>
<td>Alarm sub code</td>
<td>SUB</td>
<td>Auxiliary error code for causes of alarm</td>
</tr>
</tbody>
</table>

**Note**: When the same alarm occurs repeatedly in succession, the alarm information for the first will be preserved as the alarm history (2\(^{nd}\) last), and last occurrence as the alarm history (last). The information for other occurrences will be discarded. The number of consecutive occurrences will be preserved in the alarm history (2\(^{nd}\) last).
**Basic key operation**

(1) When the inverter is powered on, it automatically enters Running mode. In Running mode, press the \( \) key to enter Programming mode. The menu for function selection will appear.

(2) Use the \( \) / \( \) keys to move the pointer to "6. ALM INF."

(3) Press the \( \) key to call up the alarm list screen that shows information on the four most recent alarm conditions (alarm code and the number of occurrences for each alarm condition).

(4) Use the \( \) / \( \) keys to select the alarm condition to be detailed.

(5) Press the \( \) key to display the alarm code on the LED monitor and the status data screen at the time of the alarm (one out of a total of 7 pages) on the LCD monitor.

(6) Use the \( \) / \( \) keys to select the target item page and confirm the status data for that item.

(7) Press the \( \) key to return to the alarm list. Press the \( \) key again to return to the menu.

Figure 3.16 shows the LCD screen transition for "6. ALM INF."

Select the target menu by moving the pointer \( \) with \( \) / \( \) keys.

Press \( \) key to establish the target menu.

Select the target alarm by moving the cursor with \( \) / \( \) keys.

Press the \( \) key to establish the target alarm info.

![Figure 3.16 Screen Transition for "6. ALM INF"]
Figure 3.16  Screen Transition for "6. ALM INF" (continued)
3.4.8 Viewing cause of alarm -- Menu #7 "Alarm Cause" --

Menu #7 "Alarm Cause" in Programming mode allows you to view the information on the four most recent alarm conditions that triggered protective functions (in alarm code and the number of occurrences). It also shows the cause of each alarm.

Basic key operation

(1) When the inverter is powered on, it automatically enters Running mode. In Running mode, press the 
    key to enter Programming mode. The menu for function selection will appear.

(2) Use the / keys to move the pointer to "7. ALM CAUSE."

(3) Press the key to call up the alarm list screen that shows information on the four most recent alarm conditions (alarm code and the number of occurrences for each alarm condition).

(4) Use the / keys to select the alarm condition to be detailed.

(5) Press the key to display the alarm code on the LED monitor and the alarm cause screen (can be more than 1 page) on the LCD monitor.

(6) Use the / keys to view the previous or next page.

(7) Press the key to return to the alarm list. Press the key again to return to the menu.

For the details of the suspected causes of these alarms, refer to the FRENIC-Lift Instruction Manual (INR-SI47-1038-E), Chapter 6 "TROUBLESHOOTING."

Figure 3.17 shows the LCD screen transition for "7. ALM CAUSE."
Select the target menu by moving the pointer with \( \uparrow \) / \( \downarrow \) keys.

Press the \( \uparrow \) key to establish the target menu.

**Alarm list screen**

- Cause & No. of occurrences of alarm history (last)
- Cause & No. of occurrences of alarm history (2nd last)
- Cause & No. of occurrences of alarm history (3rd last)
- Cause & No. of occurrences of alarm history (4th last)

Press \( \downarrow \) key to return to Menu.

Select the target alarm by moving the cursor with \( \uparrow \) / \( \downarrow \) keys.

Alarm cause (1st page)

Press the \( \downarrow \) key to return to alarm list screen.

Use \( \uparrow \) / \( \downarrow \) keys to check all alarm causes.

Alarm cause (2nd page)

---

Pressing the \( \uparrow \) key on the "Alarm list screen" allows you to select the alarm cause of a multiple alarm to check.

Multiple alarm 2
Multiple alarm 1

Cause & No. of occurrences of alarm history (last)
Cause & No. of occurrences of alarm history (2nd last)

Press the \( \downarrow \) key to return to Menu.
3.4.9 Data copying -- Menu #8 “Data Copying” --

Menu #8 “Data Copying” in Programming mode allows you to read function code data out of an inverter for which function codes are already set up and then to write such function code data altogether into another inverter, or to verify the function code data held in the keypad with the one in the inverter.

The keypad can hold three sets of function code data in three areas of its internal memory so that it can be used with three different inverters. You can read the function code data of an inverter into one of these memory areas or write the function code data held in one of these memory areas into the inverter you select. On the LCD screen, each set of function code data or memory area is given a name such as DATA 1 and DATA 2.

Basic key operation

(1) When the inverter is powered on, it automatically enters Running mode. In Running mode, press the \[\text{key}\] to enter Programming mode. The menu for function selection will appear.

(2) Use the \[\text{/} \text{keys}\] to move the pointer \[\text{Æ}\] to “8. DATA COPY.”

(3) Press the \[\text{key}\] to call up the data copy index screen (list of data copy operations).

(4) Use the \[\text{/} \text{keys}\] to select the target operation (read, write, verify, or check).

(5) Press the \[\text{key}\] to establish the selected operation and then select data stored in the keypad.

(6) Press the \[\text{key}\] to establish the selection and perform the operation of your choice (for details, refer to the LCD screen transition diagram below).

(7) Press the \[\text{key}\] to return to the menu.

Figure 3.18 shows the LCD screen transition for “8. DATA COPY.”

1) Selecting Copy Operation

<table>
<thead>
<tr>
<th>Operation</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Read: Read data</td>
<td>Reads out function code data from the inverter and stores it into the internal memory of the keypad.</td>
</tr>
<tr>
<td>Write: Write data</td>
<td>Writes the data held in the selected memory area of the keypad into the inverter.</td>
</tr>
<tr>
<td>Verify: Verify data</td>
<td>Verifies the data held in the keypad’s internal memory against the function code data in the inverter.</td>
</tr>
<tr>
<td>Check: Check data</td>
<td>Checks the model information (format) and function code data held in the three memory areas of the keypad.</td>
</tr>
</tbody>
</table>

Figure 3.18 Screen Transition for “8. DATA COPY”

Table 3.12 List of DATA COPY Operations
2) Read Operation

List of data copy operations
Select the target operation by moving the cursor with / keys.
Press the key to establish the target operation.

Data selection screen
Select the target data by moving the cursor with / keys.
To go back to List of data copy operations, press the key.
Press key to establish the target data.

Confirmation screen
If "Read" is actually performed, the data read out from the inverter will overwrite the data held in this memory area in the keypad. If OK, press the key.
To go back to Data selection screen, press the key.
Press the key to start Read operation.

“In progress” screen
A bar indicating progress appears in the bottom.

Upon completion, Completion screen automatically appears.

Completion screen
This screen indicates that Read operation has completed successfully.
To go back to List of data copy operations, press the key.

Error screens
Pressing the or key during Read operation aborts the operation under way and displays this error. (Note) Once aborted, all the data held in the keypad’s memory would be deleted.

If a communication error is detected between the keypad and the inverter, this error screen will appear.

Figure 3.19 Screen Transition for "READ"

Note: If an ERROR screen or ERROR Ver. screen appears during operation, press the key to reset the error condition. When Reset is complete, the screen will go back to List of data copy operations.
If a communications error occurs between the keypad and inverter during Read operation, all the data held in the keypad’s memory will be deleted.
Note that, on the data selection screen for read, write, verify, and check operations, the values indicate the capacity of the inverters as listed below.

3) Write operation

### List of data copy operations
Select the target operation by moving the cursor with © / ◄ keys.

Press the © key to establish the target operation.

### Data selection screen
Select the target data by moving the cursor with © / ◄ keys.

To go back to List of data copy operations, press the ◄ key.

Press the © key to establish the target data.

### Confirmation screen
If "Write" is actually performed, the selected data will overwrite the data held in the inverter. If OK, press the © key.

To go back to Data selection screen, press the ◄ key.

Press the © key to start Write operation.

### "In progress" screen
A bar indicating progress appears in the bottom.

Upon completion, Completion screen automatically appears.

### Completion screen
This screen indicates that Write operation has completed successfully.

To go back to List of data copy operations, press the © key.

Figure 3.20 Screen Transition for "WRITE"
Pressing the \( \text{Esc} \) or \( \text{Cnt} \) key during Write operation aborts the operation under way and displays this error. Updating of the function code data in the inverter is incomplete, with some of it remaining old. Do not run the inverter in this state. Before running the inverter, redo the writing or perform initialization.

For safety considerations, the following situations are treated as an error:
- No valid data is found in the keypad’s memory. (No Read operation has been performed since factory shipment; or, a Read operation has been cancelled or aborted.)
- The data held in the keypad’s memory has an error.
- There is a mismatch in inverter’s model number.
- A Write operation has been performed while the inverter is running.
- The inverter is data-protected.

The function code data held in the keypad is incompatible with that in the inverter. (Either data may be non-standard or a version upgrade performed in the past may have made the keypad or inverter incompatible. Contact your Fuji Electric representative.)

If an ERROR screen or ERROR Ver. screen appears, press the \( \text{Esc} \) key. When Reset is complete, the screen will go back to List of data copy operations.

If an ERROR Ver. screen appears:
- To stop Write operation, press the \( \text{Cnt} \) key. When Reset is complete, the screen will go back to List of data copy operations.
- To proceed to Write operation, press the \( \text{Cnt} \) key. After completion of Write operation, be sure to perform Verify operation to check all of the unwritten functions codes and take necessary measures.
4) Verify operation

List of data copy operations
Select the target operation by moving the cursor with ▲ / ▼ keys.

Press the (key to establish the target operation.

Data selection screen
Select data to be verified by moving the cursor with ▲ / ▼ keys
To go back to List of data copy operations, press the (key.

Press the (key to establish the target data.

Confirmation screen
If OK, press the (key.
To go back to Data selection screen, press the (key.

Press the (key to start Verify operation.

"In progress" screen
A bar indicating progress appears in the bottom.

When a mismatch is found, the Verify operation is halted, with the function code and its data displayed on the LCD monitor.
To resume the Verify operation from the next function code, press the (key again.

To resume Verify, press the (key.

"In progress" screen
A bar indicating progress appears in the bottom.

Upon completion, the screen automatically switches to the VERIFYING END.

Completion screen
This screen indicates that Verify operation has completed successfully.
To go back to List of data copy operations, press the (key.

Figure 3.21 Screen Transition for "VERIFY"
**Error screens**

Pressing the \( \text{\textasciitilde} \) or \( \text{\textasciitilde} \) key during Verify operation aborts the operation under way and displays this error. (Note)

If the keypad does not have any valid data, this error screen will appear.

---

**Note**

If an ERROR screen appears, press the \( \text{\textasciitilde} \) key to reset the error factor. When Reset is complete, the screen will go back to List of data copy operations.
5) Check operation

List of data copy operations
Select the target operation by moving the cursor with \( \uparrow \) / \( \downarrow \) keys.

Press the \( \swarrow \) key to establish the target operation.

Data selection screen
Select data to be checked by moving the cursor with \( \uparrow \) / \( \downarrow \) keys.
To go back to List of data copy operations, press the \( \searrow \) key.

Press the \( \swarrow \) key to establish the target data.

"Check data" screen
This screen displays function codes and their data.
To check other function codes, press \( \uparrow \) / \( \downarrow \) keys.
To go back to List of data copy operations, press the \( \searrow \) key.

Figure 3.22  Screen Transition for "DATA CHECK"

Error screen
If no valid data is found in the keypad, this error screen will appear. (Note)

Figure 3.23  Error Screen for "DATA CHECK"

\( \text{Note} \)  If an ERROR screen appears during operation, press the \( \swarrow \) key to reset the error factor. When Reset is complete, the screen will go back to List of data copy operations.
3.4.10 *Measuring load factor*  -- Menu #9 "Load Factor Measurement" --

Menu #9 "Load Factor Measurement" in Programming mode allows you to measure the maximum output current, the average output current, and the average braking power. There are two modes of measurement: "hours set" and "start to stop" modes. In the former mode, the measurement takes place for a specified length of time; in the latter mode, the measurement takes place from the start of running to the stop.

If the "start to stop" mode is entered while the inverter is running, the measurement takes place until it is stopped. If the "start to stop" mode is entered while the inverter is stopped, the measurement will take place from the next start of running until it is stopped.

**Basic key operation**

1. When the inverter is powered on, it automatically enters Running mode. In Running mode, press the key to enter Programming mode. The menu for function selection will appear.

2. Use the / keys to move the pointer to "9. LOAD FCTR."

3. Press the key to get the measurement mode selection screen.

4. Use the / keys to select the measurement mode.

5. Press the key to start the measurement. For "start to stop" mode, you will be prompted to enter a run command via a confirmation screen. For details, refer to the LCD screen transition chart.

6. Press the key to return to the menu.

Figure 3.24 shows the LCD screen transition for "9. LOAD FCTR."

1) Selecting measurement mode

![Diagram of LCD screen transition for selecting measurement mode]

Select the target menu by moving the pointer with / keys.

To establish the target menu, press the key.

**Mode selection screen**

HOURS SET: Measurement takes place for the specified duration.

START STOP: Measurement takes place from start to stop.

EXECUTING: Measurement is taking place according to the specified duration set in HOURS SET.

To return to Menu, press the key.

Figure 3.24  Screen Transition for Selecting Measurement Mode
2) Selecting “hours set” mode

Mode selection screen
Select the target mode of measurement by moving the cursor with \(^{\uparrow}/\downarrow\) keys.

Press the \(\Rightarrow\) key to establish the target mode of measurement.

Set time duration (Default: 1 hour)

To go back to Mode selection, press the \(\Rightarrow\) key.

Set the duration with \(^{\uparrow}/\downarrow\), and \(\Rightarrow\) keys.

Press the \(\Rightarrow\) key to establish the duration and start measurement.

Measurement in progress (remaining time)
While the measurement is in progress, the remaining time is displayed.

When the \(\Rightarrow\) key is pressed or the measurement duration has elapsed, the measurement stops, displaying the results.

Specified duration

Max. output current
Average output current
Average braking power

Figure 3.25  Screen Transition for “Hours Set” Mode
3) Selecting “start to stop” mode

Mode selection screen
Select the target mode of measurement by moving the cursor with \( \uparrow / \downarrow \) keys.

Confirmation screen
If OK, press the \( \blacklozenge \) key.
To go back to Mode selection, press the \( \blacklozenge \) key.

Press the \( \blacklozenge \) key to signal “Ready.”

Waiting for Run command (Standby for measurement)
Upon receiving Run command, the measurement will start.
If a Run command has already been received, this screen will be skipped.

Measurement will start upon receiving Run command.

Measurement in progress
The measurement will continue until the inverter is stopped.
To discontinue the measurement, press the \( \blacklozenge \) key.

Measurement will stop when the inverter is stopped or you press the \( \blacklozenge \) key.

Duration
Max. output current 
Average output current 
Average braking power

Display of measurement results
To return to Mode selection, press the \( \blacklozenge \) key.

Figure 3.26 Screen Transition for “Start to Stop” Mode

4) Going back to Running mode

While the measurement of the load factor is in progress, you can go back to the running mode by pressing the \( \blacklozenge \) key (or, to the Mode selection screen by pressing the \( \blacklozenge \) key).

In these cases, the measurement of the load factor will continue. You can go back to “9. LOAD FCTR” and confirm, on the Mode selection screen, that the measurement is in progress.

After the measurement has ended, you can view the results of the measurement by pressing the \( \blacklozenge \) key on the Mode selection screen.

**Note** When the alarm occurs or the inverter power is turned off, the measurement result is cleared.
3.4.11 Changing function codes covered by Quick setup — Menu #10 "User Setting" —

Menu #10 "User Setting" in Programming mode allows you to change the set of function codes that are covered by Quick setup.

Basic key operation

1. When the inverter is powered on, it automatically enters Running mode. In Running mode, press the key to enter Programming mode. The menu for function selection will appear.

2. Use the / keys to move the pointer to "10. USER SET."

3. Press the key to call up the list of function codes.

4. Use the / keys to select the function codes to be added or deleted.

5. Press the key to perform the addition or deletion.

6. Press the key to return to the menu.

Figure 3.27 shows the LCD screen transition for "10. USER SET."

**List of function codes**

Lists function codes with their names.

The function codes covered by Quick setup are highlighted (names are highlighted).

Select the function code to be added (not highlighted) by moving the cursor with / keys.

Press the key to establish the target menu.

To go back to the menu, press the key.

Select the function code to be deleted (highlighted) by moving the cursor with / keys.

Press the key to add it to Quick setup menu.

To go back to the menu, press the key.

Press the key to delete it from Quick setup menu.

To go back to Menu, press the key.
3.4.12 Performing communication debugging -- Menu #11 "Communication Debugging" --

Menu #11 "Communication Debugging" in Programming mode allows you to view the data of communication-related function codes (S, M, W, X, and Z codes) to help debug programs for communication with host equipment.

**Basic key operation**

(1) When the inverter is powered on, it automatically enters Running mode. In Running mode, press the key to enter Programming mode. The menu for function selection will appear.

(2) Use the / keys to move the pointer to "11. COMM DEBUG."

(3) Press the key to call up the list of communication-related function codes.

(4) Use the / keys to move the cursor to the target function code.

(5) Press the key to check the function code.

(6) Press the key to return to the menu.

Figure 3.28 shows the LCD screen transition for "11. COMM DEBUG."

**List of communication-related function codes**

This screen lists function codes with their names. Select the function by moving the cursor with / keys. To go back to the menu, press the key.

**S Code**

Function code # and name  Data can be changed with / keys.

**M, W, X, Z Code**

Reference only (Cannot be changed)
3.5 Alarm Mode

When a protective function is triggered, resulting in an alarm, the inverter automatically enters the alarm mode, displaying the alarm code on the LED monitor and the details of the alarm on the LCD monitor as shown below.

**If there is no overlapping alarm**

<table>
<thead>
<tr>
<th>Alarm Code</th>
<th>Most recent cause; No. of consecutive occurrences</th>
<th>Cause of alarm</th>
<th>Operation guide</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 = Er 2 0</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>KEYPD COM ERR</td>
<td></td>

</tr>
</tbody>
</table>
Display of running status information at the time of alarm
Pressing the key with an alarm code being displayed allows you to view the output frequency, output current, and other data concerning the running status. The data viewed is the same as with "S. ALM INF." Use \( \uparrow \) and \( \downarrow \) keys for scrolling pages within the menu.
Pressing the \( \uparrow \) key with the running status information being displayed returns to the display of the alarm code.

Transition to Programming mode
Pressing the \( \uparrow \) key with alarm information being displayed switches to Programming mode in which you can use a variety of features such as changing function code data.

Resetting alarm and transition to Running mode
Removing the cause of the alarm and pressing the \( \uparrow \) key will reset the alarm condition and switch the inverter back to Running mode.

Figure 3.32 summarizes the menu transition between these modes.
3.6 Other Notes

3.6.1 Tuning motor parameters

Selecting Menu #1 “Data Setting” in Programming mode and proceeding to function code P04 or L03 screen enables tuning operation.

Motor tuning

Set function code P04 to “1” or “2,” then press the key.

Use keys to set P04 to either 1 or 2.

Press the key to establish the current tuning mode.

Wait for a run command.

Wait for the completion of tuning of the motor parameters.

(Note 1)

End of tuning

Turn the run command off. (The run command given by the keypad or the link operation is automatically turned off.)

Tuning completes. The lead-through on the keypad ends the tuning process and moves to the next function code P06.

(Note 1) Time for tuning: Approx. 15 sec when P04 = 1
Approx. 25 sec when P04 = 2

Figure 3.33 Screen Transition for Motor Tuning
Magnet pole position tuning

Set function code L03 to the target tuning and press the \( \text{A} / \text{V} \) key.

Press \( \text{A} / \text{V} \) keys to select the target tuning.

Press the \( \text{A} / \text{V} \) key to establish the current tuning mode.

Wait for a run command.

Wait for the completion of tuning.

End of tuning

Turn the run command off. (The run command given by the keypad or the link operation is automatically turned off.)

Tuning completes. The lead-through on the keypad ends the tuning process and moves to the next function code L04.

The setting range of L03 may vary depending upon the inverter's ROM version. For details about the setting range, refer to the FRENIC-Lift Instruction Manual (INR-SI47-1038-E).
3.6.2 Password protection

Function code H99 (Password) allows you to enter a password that protects your function code data from illegal access or modification by a third party. When the password protection is enabled, you cannot read nor write F00 data (Data Protection) from any method except the keypad. In addition, even when the password protection is temporarily disabled, you cannot read F00 or H99 data from any methods except the keypad.

The password protection can be temporarily canceled with F00.

</tbody>
</table>

Entering password (Enabling the password protection)

Select H99 from Menu #1 "Data Setting."

Enter a password with \( \) and \( \) keys.

Set function code H99 to nonzero.

Changing the data of H99 requires simultaneous keying of \( \) + \( \) keys or \( \) + \( \) keys.

Press the \( \) key to establish your entry.

The password is now registered. The screen returns to the DATA SET one and the password protection becomes temporarily canceled.

Note: Once a password is registered, the password protection becomes temporarily canceled. To enable the password protection, follow the procedures on the next page.
Enabling the password protection
Enter a password with the procedure given on the previous page.

Select F00 from Menu #1 "Data Setting."

Enter a password except the one preset with H99, to F00.
To change the F00 data (Data Protection), simultaneous keying of < and > keys or < and > keys is required.

Press the key to establish your password entry.
The screen returns to the DATA SET one. The password protection is enabled.

Other ways to enable password protection:
In addition to the above procedure, turn the inverter power off or leave the inverter with the password temporarily canceled for at least four hours and then switch the inverter to Running mode or Menu.

Enabling the password protection displays "PASSWORD" for all function codes except F00 and H03 on the DATA CHECK screen.

Selecting any function code except F00 and H03 with the password protection being enabled display "PASSWORD."

Press the key to return to the DATA CHECK screen.
Press the key to return to Running mode.

Figure 3.36 Screen Transition for Setting Password Protection
The password protection temporarily canceled

Select F00 from Menu #1 "Data Setting."

Enter the password preset with H99 to F00.
To change the data of F00 (Data Protection), simultaneous keying of \[\text{key} + \text{key}\] or \[\text{key} + \text{key}\] keys is required.

Press the \[\text{key}\] to establish your password entry.
The screen returns to the DATA SET one. The password protection is temporarily canceled.

Tip: With the password protection temporarily canceled, setting H99 data to a value other than 0000 enables you to register a new password.
Canceling the password protection

The password protection temporarily canceled with the procedure given on the previous page.

Select H99 from Menu #1 “Data Setting.”

Press the \( \text{(C) key once.} \)

Check that the screen shown at left appears and press the \( \text{(R) key. (H99 is set to “0000.”)} \)

The password protection is canceled.

Figure 3.38 Screen Transition for Canceling Password Protection

Tip If you forget your password, you can reset the password protection by performing “Initializing” with H03.

CAUTION

Initializing with H03 resets all the function code data to the factory defaults. Be sure to restore the proper settings that match the specifications of the system.

Accidents or injuries may result.

3.6.3 Connecting to other inverter series

Connecting the multi-function keypad TP-G1-CLS / TP-G1-ELS to an inverter other than FRENIC-Lift series displays this ERROR screen.
Chapter 4  SPECIFICATIONS

4.1 General Specifications

Table 4.1 summarizes the general specifications of the multi-function keypad TP-G1-CLS / TP-G1-ELS.

<table>
<thead>
<tr>
<th>Item</th>
<th>Specifications</th>
<th>Remarks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enclosure</td>
<td>Front side: IP40; Rear side: IP20</td>
<td></td>
</tr>
<tr>
<td>Environment</td>
<td>Indoor only. Shall be free from corrosive gases, flammable gases, dust, and direct sunlight.</td>
<td></td>
</tr>
<tr>
<td>Ambient temperature (during operation)</td>
<td>-10 to +50°C</td>
<td></td>
</tr>
<tr>
<td>Ambient humidity</td>
<td>5 to 95% RH (no condensation)</td>
<td></td>
</tr>
<tr>
<td>Altitude</td>
<td>1000 m or below</td>
<td></td>
</tr>
<tr>
<td>Vibration</td>
<td>3 mm (max.): 2 - 9 Hz</td>
<td></td>
